# Making a PowerPoint Slideshow

A slideshow movie can be used on a website or an interactive multimedia product. It adds movement and, possibly, sound – both of which can add interest to a product.

## Save Images

1.  You need to find **five good quality**, **large images** and save them.
    Make sure you change the settings to search for **large** or **very large** images
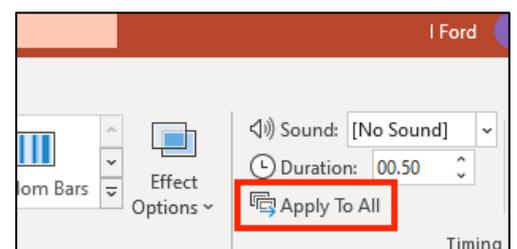

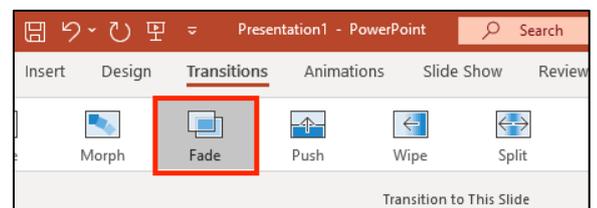

## Create the Presentation

2.  Make a new **five slide presentation**

3.  Get rid of any text boxes from each page

4.  Add the images to each page: **Insert** >

    **Pictures** > **This device**

5.  **Resize** the images to fill the whole slide
    This is why you need to use large or very large images

## Add Transitions

A stylish transition on each page really makes your slideshow better

6.  Click **Transitions** at the top > choose a stylish transition – I suggest **<u>Fade</u>** is the best option
    Push, wipe, cover or uncover also work quite well, but Fade is really the most stylish

7.  Click **Apply to All** at the **<u>top right</u>**
    Having the same transition on each slide makes your slideshow look much more professional

## *Automate the Slides*

8. Click **Transitions** at the top

9. At the **top right**, find the **Advance Slide** section. **Tick** the **After box**

10. Change the time to **5 seconds** (00:05.00)

11. **Repeat** this on every slide
   There is no way to apply this to all slides

## *Export the Slideshow*

12. **Save** your work first

To work as a slideshow the presentation needs to be exported as a video file

13. Click **File** > **Export** > choose **Create a Video**

14. Check the settings are the same as on the screenshot below

15. Click **Create Video**

   It takes a while to render the video file

## *Finishing off*

16. You will need to move your video file into your One Drive

17. Now you can use **Kapwing** to add sound and titles to your slideshow
